

## Assignment 2 Report

We have used reactjs for the frontend part and nodejs for the backend part. In the backend using express server we connected to the postgresql database present locally in the system. The backend server runs on PORT 8000.

We built frontend using npx create react app. Later We added the required components and routes. This frontend runs on PORT 3000.

To send requests to backend we used the axios.post methods. To receive information from backend we used axios.get methods. Also in the backend using the “pg” module we had done the required queries to the database.
